Brainstorming & Idea Prioritization

Implement Client Script & UI Policy (Incident)

Project Focus

The project demonstrates how ServiceNow client-side controls can improve Incident data integrity through conditional field behavior, automatic values, validation, and submission controls.

Brainstorming

No.	Brainstormed Idea	ServiceNow Feature	Purpose
1	Make Assignment Group mandatory when Impact is High	UI Policy	Ensure high-impact incidents are properly routed.
2	Make Urgency mandatory under specific conditions	UI Policy	Improve incident prioritization.
3	Auto-populate a field based on user input	Client Script	Reduce manual data entry.
4	Display or hide fields based on incident conditions	UI Policy	Make the form easier to use.
5	Validate required information before saving	Client Script	Prevent incomplete records.
6	Show an alert when incorrect information is entered	Client Script	Help users correct errors.
7	Change field behavior dynamically	UI Policy	Enforce business rules.
8	Prevent submission when important information is missing	Client Script	Maintain data integrity.
9	Automatically set a default value	Client Script	Improve consistency.
10	Reverse field behavior when conditions are no longer met	UI Policy	Keep the form dynamic.

Idea Prioritization – Impact vs. Effort

Idea	Impact	Effort	Priority
Assignment Group mandatory for High Impact	High	Low	1 – Highest
Prevent submission when required data is missing	High	Medium	2 – High
Dynamic field visibility	High	Low	3 – High
Auto-populate field values	Medium	Low	4 – Medium
Urgency mandatory based on condition	Medium	Low	5 – Medium
Incorrect-input alert	Medium	Medium	6 – Medium
Default field value	Medium	Low	7 – Medium
Dynamic field behavior	Medium	Medium	8 – Medium
Reverse field behavior	Low	Low	9 – Low
Additional form validations	Low	Medium	10 – Low

Selected Ideas for the Project

1. Conditional Mandatory Field	When Impact = High, make Assignment Group mandatory using a UI Policy.

2. Dynamic Field Control	Show, hide, or change field behavior depending on Incident conditions.
3. Client-Side Validation	Use a Client Script to check required information before the Incident is submitted.
4. Auto-Population	Automatically populate an appropriate value when specified conditions are met.
5. Submission Prevention	Prevent submission when important business rules are not satisfied.

Final Prioritized Solution

Problem → Identify Incident data-entry problems → **Brainstorm** UI Policy and Client Script solutions → **Prioritize** based on Impact + Effort + Relevance → **Implement** selected controls → **Result** Improved Incident data integrity, consistency, and validation.

Skills Applied

Incident Management • UI Policy • UI Policy Actions • Client Scripts • Form Validation
