DEFINE THE PROBLEM STATEMENT

Implement Client Script & UI Policy (Incident)

1. Problem Definition Template – 5W1H

Question	Problem Definition
What is the problem?	Incident records may contain incomplete, inconsistent, or incorrect information because users rely on manual data entry and awareness.
Who is affected?	ServiceNow users who create or update Incident records, as well as teams involved in triage, routing, reporting, and resolution.
Where does it occur?	At the Incident form/interface level when users enter or update Incident information.
When does it occur?	During Incident creation or modification, especially when specific business conditions require additional or valid information.
Why is it important?	Poor data quality can affect incident routing, reporting accuracy, SLA compliance, and overall service quality.
How can it be addressed?	Use UI Policies and Client Scripts to dynamically control fields, enforce mandatory information, validate inputs, auto-populate values, and prevent invalid submissions.

2. Problem Statement – Current Situation

Incident records in ServiceNow require consistent and accurate data entry for effective triage, routing, resolution, reporting, and SLA management. However, relying mainly on user awareness and manual checks can result in incomplete, inconsistent, or incorrect information being submitted. The absence of sufficient conditional field controls and form-level validation can allow records that do not meet defined business rules to be created or updated.

3. Root Cause / Contributing Factors

Factor	Description
Manual data entry	Users must enter information manually, increasing the possibility of missing or inconsistent data.
Limited conditional control	Fields may not automatically become mandatory or change behavior when specific conditions are met.
Insufficient validation	Invalid or incomplete information may not always be identified before submission.
Lack of standardized behavior	Different users may enter Incident information differently without consistent interface-level rules.

4. Impact of the Problem

Incomplete Incident records • Inconsistent or incorrect data • Inefficient triage and routing • Reduced reporting accuracy • Potential SLA compliance issues • Lower overall service quality

5. Proposed Problem-Solving Direction

UI Policies: Control field visibility, mandatory status, and field behavior based on Incident conditions.
UI Policy Actions: Apply the required field-level changes dynamically.
Client Scripts: Auto-populate values and perform client-side validation.
Form Validation: Prevent submission when required business conditions are not satisfied.

6. Final Defined Problem Statement

Problem: ServiceNow Incident records can be submitted with incomplete, inconsistent, or invalid information when data entry depends mainly on manual checks.

Need: A standardized client-side solution is required to enforce conditional field behavior and validation directly on the Incident form.

Direction: Implement UI Policies, UI Policy Actions, and Client Scripts to dynamically control fields, enforce mandatory information, auto-populate values, validate inputs, and prevent invalid Incident submissions.

Expected improvement: Better data integrity, consistency, routing, reporting accuracy, and overall Incident management quality.
