Customer Journey Map: Incident Lifecycle

From opening the form to closing the record, with UI Policies & Client Scripts in action

	STAGE 1 Open Incident	STAGE 2 Capture Details	STAGE 3 Dynamic Form Behaviour	STAGE 4 Validate & Submit	STAGE 5 Triage & Route	STAGE 6 Resolve & Close
ACTIONS	Clicks Incident > Create New. The form loads for a new record.	Enters caller, category, short description, impact and urgency.	Changes selections; fields appear, hide or become required.	Clicks Submit. Browser-side checks run before the save.	Assignment group and priority place the ticket in a queue.	Sets State to Resolved and documents the fix.
TOUCHPOINTS	Incident form onLoad Client Script	Category, Subcategory, Impact, Urgency fields	UI Policy UI Policy Actions	onSubmit Client Script Form messages	Assignment rules, SLA, queues	State, Resolution code and notes
THINKING	"Is the form ready with useful defaults?"	"What details am I expected to provide?"	"The form shows only what is relevant."	"I am told exactly what is missing."	"This should reach the right team first time."	"The fix is recorded, so I can trust it."
FEELING						
PAIN POINTS	Blank fields and no defaults lead to varied entries.	Wrong or skipped category and priority values.	Irrelevant fields clutter the form; key ones get missed.	Incomplete records saved; SLA and reports skewed.	Mis-routing, rework and delayed triage.	Resolved with no notes; weak audit trail.
CONTROLS APPLIED	onLoad script auto-populates defaults for new records.	onChange script keeps dependent values consistent.	UI Policy sets Mandatory / Visible / Read-only by condition.	onSubmit script aborts save and shows a clear error.	Complete data drives accurate assignment and SLA.	UI Policy requires Resolution code and notes.

Feeling row compares the experience before the client-side controls (left face) with the experience after UI Policies and Client Scripts are applied (right face).
