1 Data Flow Diagram - Level 0 (Context)

The context diagram shows the whole solution as a single process, the people who interact with it, and the two data stores it depends on.

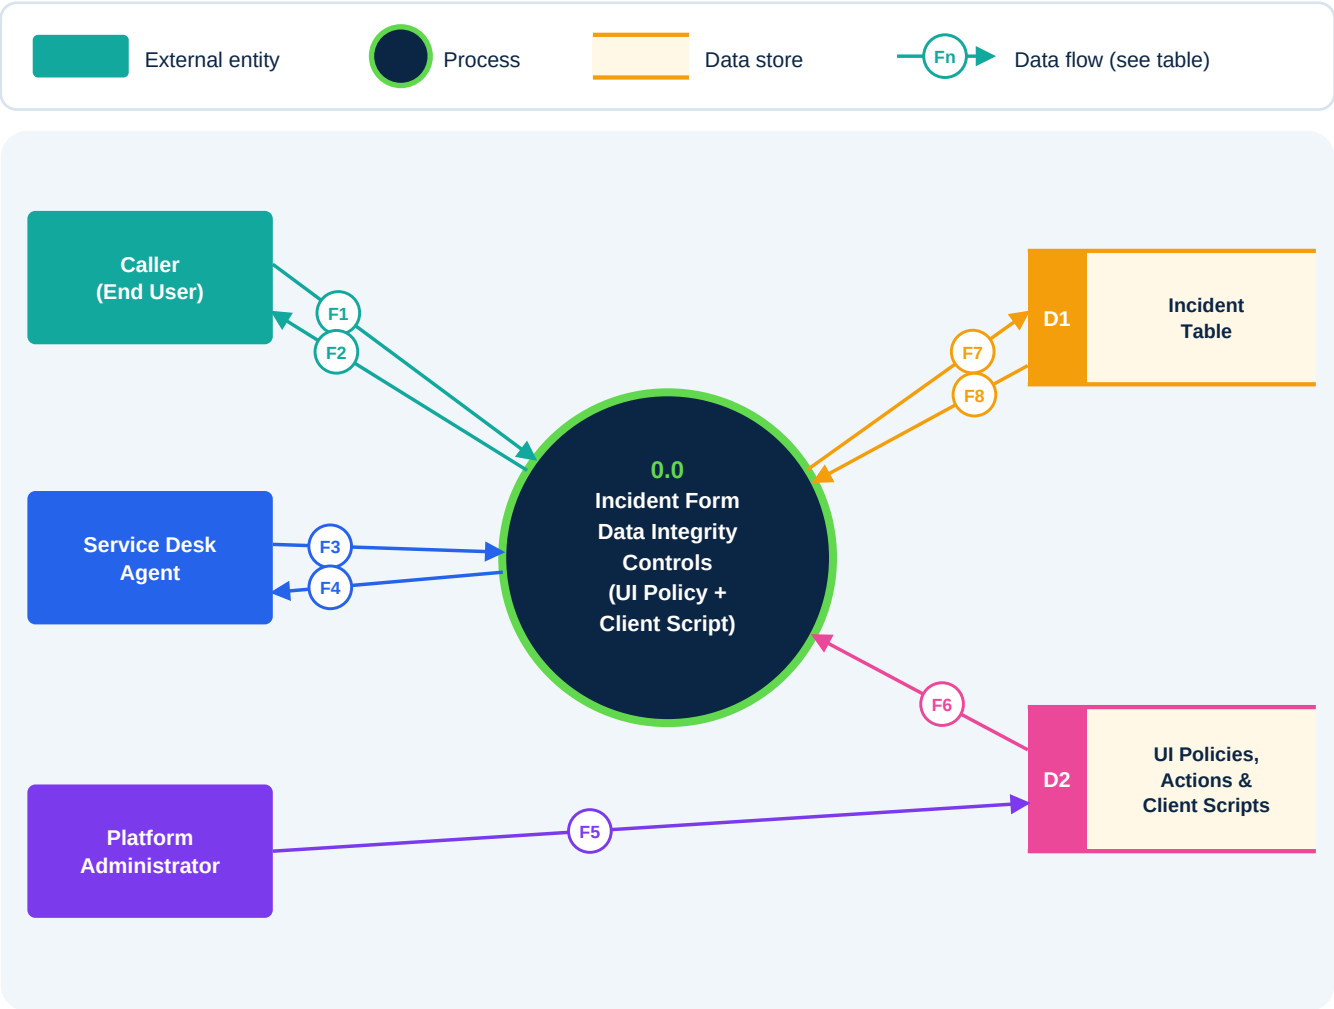

Figure 1: Level 0 context diagram

Flow	Direction	Data carried
F1	Caller -> 0.0	Incident details (caller, short description, category, impact, urgency)
F2	0.0 -> Caller	Field behaviour feedback and validation / error messages
F3	Agent -> 0.0	Updates, state changes and resolution information
F4	0.0 -> Agent	Mandatory / read-only / hidden field state and save-time errors
F5	Administrator -> D2	Create and maintain UI Policies, UI Policy Actions and Client Scripts
F6	D2 -> 0.0	Active rule definitions: conditions, actions and script logic
F7	0.0 -> D1	Validated Incident record (insert / update)
F8	D1 -> 0.0	Existing Incident record values when a form is opened

2 Data Flow Diagram - Level 1

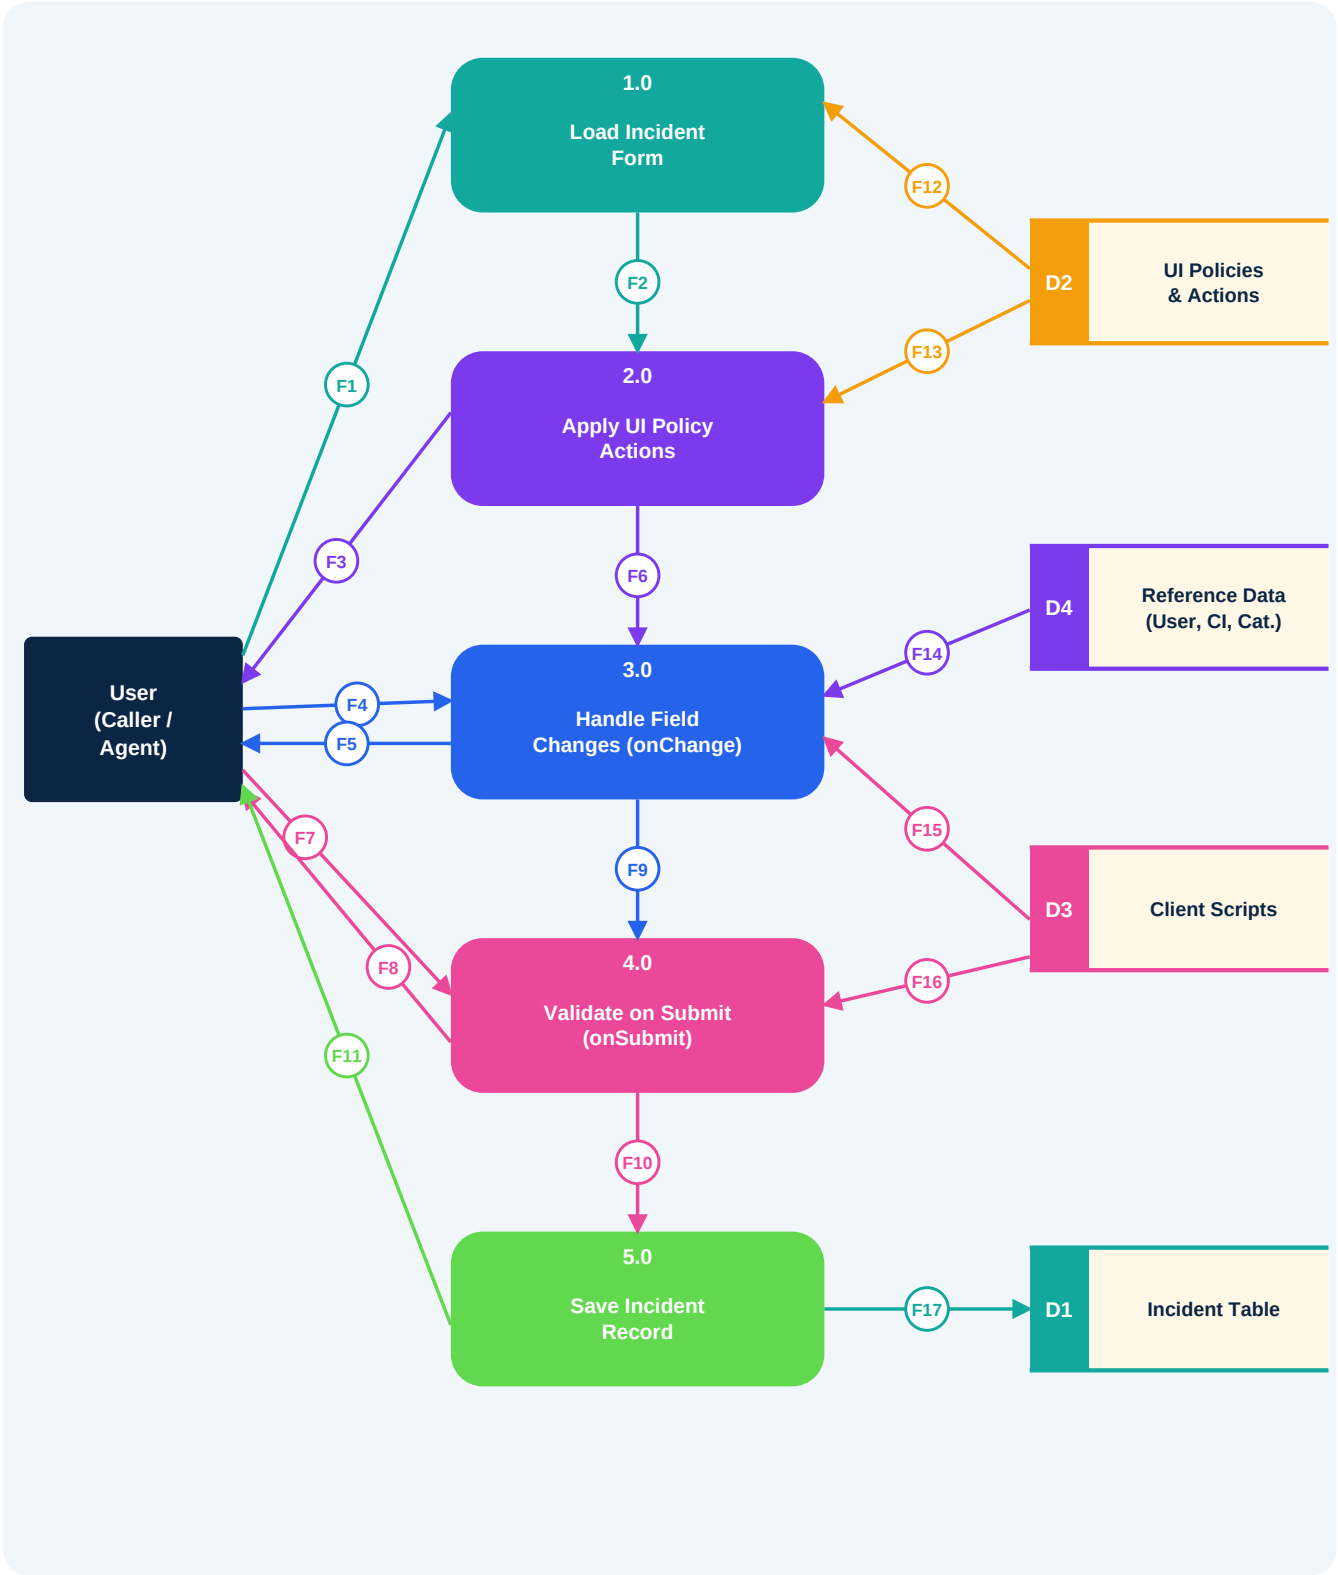

Figure 2: Level 1 decomposition of process 0.0 (flow tags F1-F17 are listed on the next page)

Level 1 Data Flows

Flow	Direction	Data carried
F1	User -> 1.0	Request to open / create an Incident
F2	1.0 -> 2.0	Loaded form values and current field state
F3	2.0 -> User	Fields shown / hidden, made mandatory or read-only
F4	User -> 3.0	Edits to field values (Caller, Category, State, Impact...)
F5	3.0 -> User	Auto-populated / cleared field values
F6	2.0 -> 3.0	Applied field state handed to change handling (changed values re-trigger UI Policy conditions)
F7	User -> 4.0	Save / Submit / Update action
F8	4.0 -> User	Error messages; submission blocked until fixed
F9	3.0 -> 4.0	Current form state passed to submit checks
F10	4.0 -> 5.0	Validated Incident data (all rules passed)
F11	5.0 -> User	Save confirmation and updated record
F12	D2 -> 1.0	Initial UI Policy conditions evaluated on load
F13	D2 -> 2.0	UI Policy Actions (visible, mandatory, read-only)
F14	D4 -> 3.0	Caller / location / CI / category lookups
F15	D3 -> 3.0	onChange script logic
F16	D3 -> 4.0	onSubmit script logic
F17	5.0 -> D1	Insert / update Incident record

3 User Stories

Stories follow the format *As a [role], I want [capability], so that [benefit]*, grouped into epics that map to the processes in the data flow diagram.

High Medium Low Priority legend

Epic A: Conditional Field Behaviour (UI Policy & UI Policy Actions)

ID	User story	Acceptance criteria	Priority
US-01	As a **Service Desk Agent**, I want to have Close code and Close notes become mandatory when State is Resolved or Closed, so that every closed incident carries a documented resolution.	Fields show a mandatory marker when State = Resolved/Closed; save is blocked while empty; marker is removed when State changes back (Reverse if false).	High
US-02	As a **Service Desk Agent**, I want to see an On hold reason field, mandatory, only when State is On Hold, so that paused incidents always explain why and the form stays uncluttered.	Field is visible and mandatory only for State = On Hold; hidden and cleared otherwise.	Medium
US-03	As a **Service Desk Agent**, I want to have resolution-related fields hidden until the incident reaches a resolving state, so that I focus on triage fields during early handling.	Resolution section hidden for New / In Progress; shown for Resolved / Closed.	Low
US-04	As a **Service Desk Manager**, I want to have the Caller field become read-only once an incident is no longer New, so that the original requester cannot be altered by mistake.	Caller read-only when State != New; editable on a new record.	Medium

Epic B: Auto-populate & Field Behaviour (Client Scripts - onLoad / onChange)

ID	User story	Acceptance criteria	Priority
US-05	As a **Service Desk Agent**, I want to have contact and location details auto-populated when I select a Caller, so that I do not retype data and records stay consistent.	onChange on Caller fills Location (and contact details) from the user record; value updates if Caller changes.	High
US-06	As a **Service Desk Agent**, I want to have Subcategory cleared when Category changes, so that mismatched category / subcategory pairs are never saved.	onChange on Category clears Subcategory; Subcategory choices refresh to match the new Category.	Medium
US-07	As a **Caller**, I want to see helpful on-form guidance (field message) on key fields, so that I can describe my issue completely the first time.	onLoad / onChange displays an info message on Short description explaining the expected detail.	Low

Epic C: Save-time Validation (Client Script - onSubmit)

ID	User story	Acceptance criteria	Priority
US-08	As a **Service Desk Manager**, I want to have Incident submission blocked when Short description is too short or empty, so that triage and routing receive meaningful summaries.	onSubmit returns false and shows an error message when Short description is below the minimum length; save succeeds once corrected.	High

ID	User story	Acceptance criteria	Priority
US-09	As a **Service Desk Manager**, I want to require Description and Configuration item for high-impact incidents, so that critical incidents have enough information for fast resolution and correct SLA handling.	When Impact = High, onSubmit blocks save until Description and CI are provided; clear error shown per field.	**High**
US-10	As a **Service Desk Agent**, I want to get clear, specific error messages next to the offending field, so that I can fix the problem in one attempt.	Messages name the field and the rule; focus moves to the first failing field; no generic failure alerts.	**Medium**

Epic D: Governance, Quality & Reporting

ID	User story	Acceptance criteria	Priority
US-11	As a **Platform Administrator**, I want to manage all rules as documented UI Policies and Client Scripts captured in an update set, so that behaviour is auditable, portable and easy to maintain.	Each rule has a name, description, condition and table = Incident; update set contains all records.	**Medium**
US-12	As a **QA Tester**, I want to have positive and negative test cases for every rule, so that regressions are caught before release.	A test matrix covers each story: pass case, fail case and rule-reversal case.	**Medium**
US-13	As a **Reporting Analyst**, I want to receive complete and consistent incident data, so that dashboards, reports and SLA compliance figures are trustworthy.	Required fields are populated on 100% of newly created incidents following the defined rules.	**High**
