PROJECT PLANNING PHASE

Implement Client Script & UI Policy (Incident)

Enforcing data integrity on ServiceNow Incident records with conditional field behaviour and save-time validation.

PROBLEM

Incomplete, inconsistent or incorrect Incident data hurts triage, routing, reporting accuracy and SLA compliance when it relies only on user awareness and manual checks.

OBJECTIVE

Use UI Policies and Client Scripts to make fields mandatory, auto-populate values, control field behaviour and block submission until business rules are met.

Incident Management | UI Policy | UI Policy Actions | Client Scripts | Form Validation

Product backlog and sprint plan

Sprint	Sprint goal	Key user stories	Points	Dates (2026)
Sprint-1	Set up the environment, build UI Policies and UI Policy Actions	USN-1 PDI and update set setup USN-3 Assignment group mandatory when Priority is Critical USN-4 Close code and notes mandatory on Resolved / Closed USN-5, 6 Field visibility and UI Policy scripts USN-7 UI Policy testing	**20**	05 Oct to 10 Oct
Sprint-2	onLoad and onChange Client Scripts, read-only field control	USN-8 Auto-populate fields on form load USN-9 Message when priority becomes Critical USN-10 Clear Subcategory when Category changes USN-12 Read-only fields on closed Incidents USN-13, 14 Script testing and documentation	**20**	12 Oct to 17 Oct
Sprint-3	onSubmit validation, regression testing, UAT and documentation	USN-15 Block save when Short description / Description is invalid USN-16 Clear error messages when rules fail USN-17, 18 Regression testing and UAT USN-19, 20 Project report and demo	**20**	19 Oct to 24 Oct

Backlog total: 20 user stories, 60 story points. Priorities: High, Medium, Low. Business rules shown are sample rules for the Incident form.

Velocity and definition of done

20	60	18	3.33
user stories	story points	days, 3 sprints of 6	points per day

DEFINITION OF DONE

- UI Policies and Client Scripts are active on the Incident table
- Mandatory, visible and read-only rules work for each condition
- Saving is blocked with a clear message when a validation rule fails
- Every story is tested with positive and negative cases and documented

STORY POINT SCALE

1	Trivial: configuration only
2	Small: single UI Policy action
3	Medium: conditional policy or basic script
5	Large: multi-condition onSubmit validation

Velocity = 20 story points / 6 days per sprint = 3.33 points per day
